

## **Beijing Summit to Help Plot Future Course in Financial Technology Industry**

The finance industry has been strongly affected by the use of new technologies. Tools such as cloud computing, blockchain, and big data analysis, have altered the landscape of doing business. This phenomenon has taken hold in China as well, and overseas venture capital investment has poured into the Chinese financial technology sector in recent years.

On account of these developments, Duxes will hold the China FinTech Summit 2017 on May 18-19 in Shanghai. The two day summit will gather representatives of leading financial and technology companies, as well as industry analysts and experts, to exchange ideas on important issues related to financial technology.

The summit's first day will include presentations from representatives of prominent financial institutions, notably the Bank of China and ICBC, on the regulatory environment for the financial industry in China, and the ongoing digitalization of the industry, characterized by new models of internet finance. Further testimony from renowned technology companies, including Microsoft and IBM, will break down technical advances related to data, cloud computing, and blockchain, while also addressing related security concerns. The second day of the event will continue with content on the abundant applications for new technologies, in banking, insurance, securities, payment methods, and wealth, and the promising products and services available due to continuing innovation in the field.

The China FinTech Summit 2017 furthers Duxes' Financial Series of events, and offers a platform for debate, discussion, and collaboration in a growing industry.

Professionals working in the finance industry, for technology companies, and related areas, are invited to attend.
